

# **Design Amazon - Online Shopping System**

Let's design an online retail store.

Amazon (amazon.com) is the world's largest online retailer. The company was originally a bookseller but has expanded to sell a wide variety of consumer goods and digital media. For the sake of this problem, we will focus on their online retail business where users can sell/buy their products.

### **Requirements and Goals of the System**

We will be designing a system with the following requirements:

- 1. Users should be able to add new products to sell.
- 2. Users should be able to search for products by their name or category.
- 3. Users can search and view all the products, but they will have to become a registered member to buy a product.
- 4. Users should be able to add/remove/modify product items in their shopping cart.
- 5. Users can check out and buy items in the shopping cart.
- 6. Users can rate and add a review for a product.
- 7. The user should be able to specify a shipping address where their order will be delivered.
- 8. Users can cancel an order if it has not shipped.
- 9. Users should get notifications whenever there is a change in the order or shipping status.
- 10. Users should be able to pay through credit cards or electronic bank transfer.
- 11. Users should be able to track their shipment to see the current state of their order.

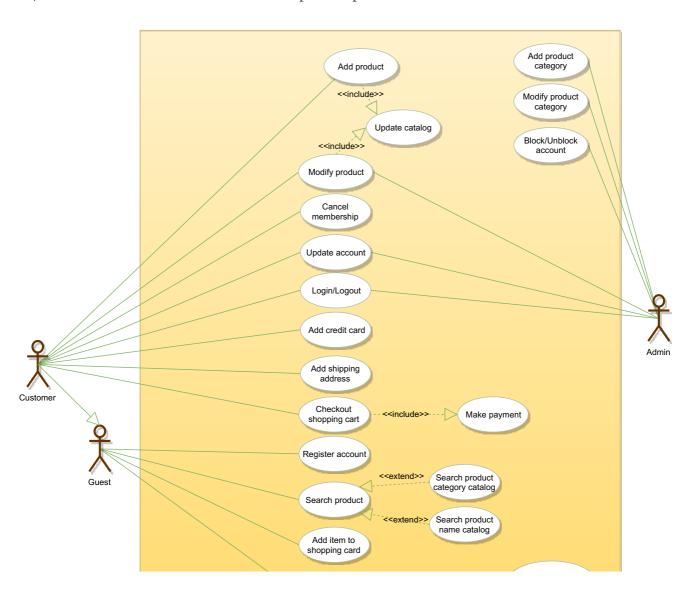

#### Use case Diagram

#### We have four main Actors in our system:

- Admin: Mainly responsible for account management and adding or modifying new product categories.
- **Guest:** All guests can search the catalog, add/remove items to the shopping cart, as well as become registered members.
- **Member:** Members can perform all the activities that guests can, in addition to which, they can place orders and add new products to sell.
- System: Mainly responsible for sending notifications for orders and shipping updates.

#### Here are the top use cases of the Online Shopping System:

- 1. Add/update products; whenever a product is added or modified, we will update the catalog.
- 2. Search for products by their name or category.
- 3. Add/remove product items in the shopping cart.
- 4. Check-out to buy product items in the shopping cart.
- 5. Make a payment to place an order.
- 6. Add a new product category.
- 7. Send notifications to members with shipment updates.

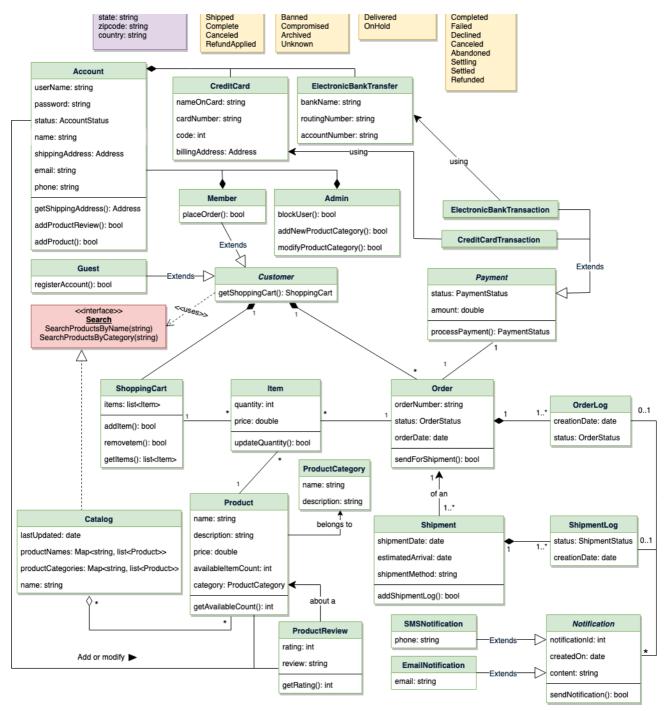

### Class diagram

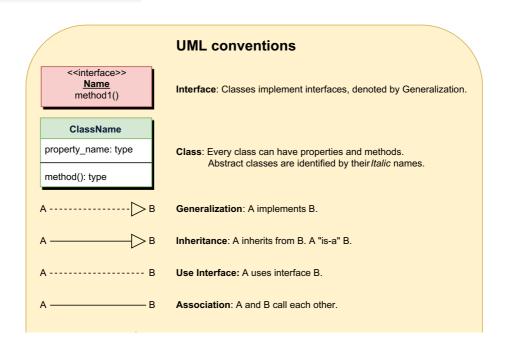

Here are the descriptions of the different classes of our Online Shopping System:

- **Account:** There are two types of registered accounts in the system: one will be an Admin, who is responsible for adding new product categories and blocking/unblocking members; the other, a Member, who can buy/sell products.
- **Guest:** Guests can search for and view products, and add them in the shopping cart. To place an order they have to become a registered member.
- Catalog: Users of our system can search for products by their name or category. This class will keep an index of all products for faster search.
- ProductCategory: This will encapsulate the different categories of products, such as books, electronics, etc.
- **Product:** This class will encapsulate the entity that the users of our system will be buying and selling. Each Product will belong to a ProductCategory.
- **ProductReview:** Any registered member can add a review about a product.
- **ShoppingCart:** Users will add product items that they intend to buy to the shopping cart.
- **Item:** This class will encapsulate a product item that the users will be buying or placing in the shopping cart. For example, a pen could be a product and if there are 10 pens in the inventory, each of these 10 pens will be considered a product item.
- **Order:** This will encapsulate a buying order to buy everything in the shopping cart.
- **OrderLog:** Will keep a track of the status of orders, such as unshipped, pending, complete, canceled, etc.
- **ShipmentLog:** Will keep a track of the status of shipments, such as pending, shipped, delivered, etc.
- **Notification:** This class will take care of sending notifications to customers.
- **Payment:** This class will encapsulate the payment for an order. Members can pay through credit card or electronic bank transfer.

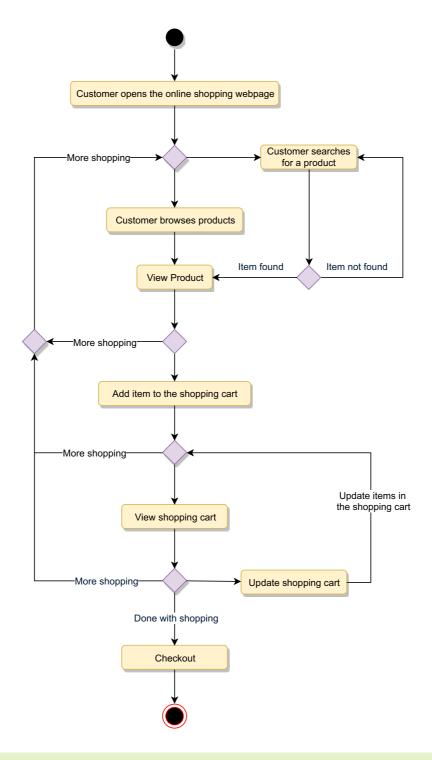

Class diagram for Online Shopping System

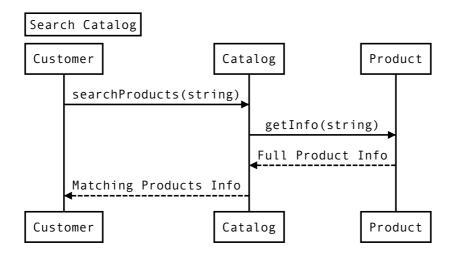

## **Activity Diagram**

Following is the activity diagram for a user performing online shopping:

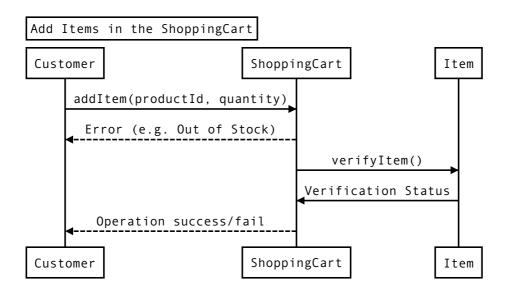

### **Sequence Diagram**

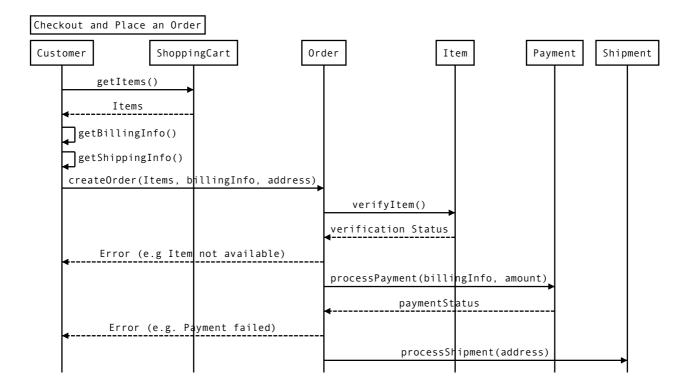

1. Here is the sequence diagram for searching from the catalog:

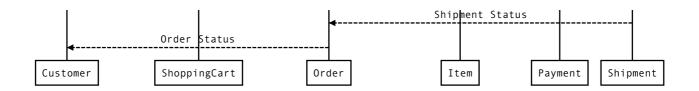

2. Here is the sequence diagram for adding an item to the shopping cart:

3. Here is the sequence diagram for checking out to place an order:

#### Code

Ħ

Here is the high-level definition for the classes described above.

**Enums, data types, and constants:** Here are the required enums, data types, and constants:

```
public class Address {
    private String streetAddress;
    private String state;
    private String state;
    private String zipCode;
    private String country;
}

public enum OrderStatus {
    UNSHIPPED, PENDING, SHIPPED, COMPLETED, CANCELED, REFUND_APPLIED
}

public enum AccountStatus {
    ACTIVE, BLOCKED, BANNED, COMPROMISED, ARCHIVED, UNKNOWN
}

public enum ShipmentStatus {
    PENDING, SHIPPED, DELIVERED, ON_HOLD,
}

public enum PaymentStatus {
    UNPAID, PENDING, COMPLETED, FILLED, DECLINED, CANCELLED, ABANDONED, SETTLING, SETTLED, REFUNDED
}
```

**Account, Customer, Admin, and Guest:** These classes represent different people that interact with our system:

```
// For simplicity, we are not defining getter and setter functions. The reader can
// assume that all class attributes are private and accessed through their respective
// public getter methods and modified only through their public methods function.

public class Account {
   private String userName;
   private String password;
   private AccountStatus status;
   private String name;
   private Address shippingAddress;
   private String email;
   private String phone;

private List<CreditCard> creditCards;
   private List<ElectronicBankTransfer> bankAccounts;

public boolean addProduct(Product product);
   public boolean addProductReview(ProductReview review);
```

```
public boolean resetPassword();
}

public abstract class Customer {
    private ShoppingCart cart;
    private Order order;

public ShoppingCart getShoppingCart();
    public bool addItemToCart(Item item);
    public bool removeItemFromCart(Item item);
}

public class Guest extends Customer {
    public bool registerAccount();
}

public class Member extends Customer {
    private Account account;
    public OrderStatus placeOrder(Order order);
}
```

**ProductCategory, Product, and ProductReview:** Here are the classes related to a product:

```
public class ProductCategory {
 private String name;
 private String description;
public class ProductReview {
 private int rating;
 private String review;
 private Member reviewer;
public class Product {
 private String productID;
 private String name;
 private String description;
 private double price;
 private ProductCategory category;
 private int availableItemCount;
 private Account seller;
 public int getAvailableCount();
 public boolean updatePrice(double newPrice);
```

**ShoppingCart, Item, Order, and OrderLog:** Users will add items to the shopping cart and place an order to buy all the items in the cart.

```
public class Item {
  private String productID;
  private int quantity;
  private double price;

  public boolean updateQuantity(int quantity);
}
```

```
Partic Ciaro Dispringuate (
 private List<Items> items;
 public boolean addItem(Item item);
 public boolean removeItem(Item item);
 public boolean updateItemQuantity(Item item, int quantity);
 public List<Item> getItems();
 public boolean checkout();
public class OrderLog {
 private String orderNumber;
 private Date creationDate;
 private OrderStatus status;
public class Order {
 private String orderNumber;
 private OrderStatus status;
 private Date orderDate;
 private List<OrderLog> orderLog;
 public boolean sendForShipment();
 public boolean makePayment(Payment payment);
 public boolean addOrderLog(OrderLog orderLog);
```

**Shipment, ShipmentLog, and Notification:** After successfully placing an order, a shipment record will be created:

```
public class ShipmentLog {
 private String shipmentNumber;
 private ShipmentStatus status;
 private Date creationDate;
public class Shipment {
 private String shipmentNumber;
 private Date shipmentDate;
 private Date estimatedArrival;
 private String shipmentMethod;
 private List<ShipmentLog> shipmentLogs;
 public boolean addShipmentLog(ShipmentLog shipmentLog);
public abstract class Notification {
 private int notificationId;
 private Date createdOn;
 private String content;
 public boolean sendNotification(Account account);
```

**Search interface and Catalog:** Catalog will implement Search to facilitate searching of products.

```
public interface Search {
  public List<Product> searchProductsByName(String name);
  public List<Product> searchProductsByCategory(String category);
}
```

```
public class Catalog implements Search {
  HashMap<String, List<Product>> productNames;
  HashMap<String, List<Product>> productCategories;
  public List<Product> searchProductsByName(String name) {
   return productNames.get(name);
 public List<Product> searchProductsByCategory(String category) {
   return productCategories.get(category);
```
